Appropriate Opioid Prescribing for Acute Pain after Surgery

Richard J. Barth Jr.
Professor of Surgery
Chief, Section of General Surgery
Dartmouth Hitchcock Medical Center

American Urologic Association Quality Summit
December 8, 2018
The Opioid Epidemic: Introduction

Opioid overdoses now leading cause of injury related deaths:

42,000 opioid overdose deaths in US 2016

37,000 motor vehicle crash deaths in US 2016

Opioid prescribing has also quadrupled in the past 15 years and is highly prevalent:

82.5 prescriptions per 100 persons per year

---

Surgeons play an important role in the opioid epidemic

Surgeons commonly prescribe opioids after surgery

Prescribing opioids for our patients has risks for them:

• 5-10% of opioid naïve patients become chronic users after prescribed opioids for surgery.

The pills our patients don’t use can be used by others:

• Diversion: 71% of users get drugs by diversion.
5-10% of opioid naïve patients become chronic users after prescribed opioids for surgery

Initial prescription size matters…

A. Shah MMWR 2017; 66: 265-9

Studied 1,250,000 opioid naïve patients

• 1 day prescription: 6% chance on opioids @ 1 year

• 8 + day prescription: 13% chance on opioids @ 1 year

PREVENT long term use by right-sizing initial opioid prescription
Literature Review: 2015

Few studies exist that address optimal post-operative opioid prescriptions

- Urologic, oral, hand, and upper extremity surgery

No studies looking at best prescribing practices in general surgery

J Urology. 2011. 185: 551-555
J Hand Surg Am. 2015;40(2):341e346

275 patients Univ Utah responded phone or letter survey opioid consumption

90% given an opioid prescription

Mean number pills prescribed: 25

Only about half of prescribed opioids were consumed.

2/3 patients had opioids left over

Only 8% of patients were given instructions on how to dispose of leftover meds

Stopped short of recommending opioid prescription guidelines

J Am Col Surg, 2018, 226: 996-1003
Methods

• The 5 most common outpatient procedures performed June-Dec 2015:
  partial mastectomy, partial mastectomy with sentinel lymph node biopsy, laparoscopic cholecystectomy, laparoscopic inguinal hernia repair, open inguinal hernia repair

• Post-operative opioid prescription data and opioid refill data were obtained

• Patients with recent opioid use, history of opioid abuse, and those with post-operative complications were excluded

• We called patients and asked them how many opioids they took.

57% decrease
All provider education intervention

- We presented opioid use data and these guidelines at General Surgery section meeting, sent emails, resident teaching session April, May 2016

- Recommended use acetaminophen and ibuprofen first, then opioids

  - What % of pts will have 50% reduction in pain for 6 hours (Cochrane)?

    | Treatment                          | 50% Reduction |
    |-----------------------------------|---------------|
    | Ibuprofen and acetaminophen       | 73%           |
    | Ibuprofen alone                   | 52%           |
    | Oxycodone                         | 23%           |
    | Placebo                           | 17%           |

- Observed opioid prescribing patterns same 5 outpatient operations, June-September 2016, 224 patients

- Collected data on opioid use

Effect of education intervention on total number of opioid pills actually prescribed

53% decrease!
Were patient’s pain medication needs met?

Of 224 patients,

• Only 34% of the prescribed opioids were taken.

• Only 1 patient (<0.5%) required an opioid refill.

Answer: YES!
Analgesic use after partial mastectomy
How many opioids should be prescribed to patients who are discharged after surgery which requires an *inpatient* admission?

Laws limiting number of pills prescribed to a “7 day supply”

**Ambiguity:**
Is a 7 day supply 21 pills (1 every 6 hrs while awake) or 84 (2 every 4 hrs)?
Do you assume the patients will use less pills every day?
Is 7 days the right number, or 5, or 10?
Methods

Six common inpatient operations July –Dec, 2016:

Studied 333 patients

Excluded patients chronic opioid use, complications, discharged to nursing facility

85% sent home with opioid prescription
Analysis Groups

DC on POD = 1

↓

Home opioid use

DC on POD ≥ 2

↓

Inpatient use on day prior to discharge

↓

Home opioid use
Home opioid use for patients discharged on POD 1
Univariate and multivariate analysis of factors associated with home opioid use

We found:

1) The number of pills taken the day prior to discharge was the best predictor of how many opioids were used at home

2) Opioid use at home after inpatient admission was independent of the operation performed
No opioid pills taken day prior to discharge
1-3 opioid pills taken on day prior to discharge
≥ 4 opioid pills taken day prior to discharge

Percent

Home Opioid Use After Discharge (Pills)
Prescription guidelines to satisfy 85% of patients’ home opioid usage

Potential Savings in Opioid Pills
Prescribed if our Guidelines were Used

40%
So, how many opioids should I prescribe to my next urology patient?

1. You could use our guideline based on the number they used the day before discharge. (1 pill = 5 mg oxycodone)

<table>

Mayo Guideline: 80% of the IQR for opioid naïve pts

Thiels C et al Ann Surg 2018; 268: 457-68
Fujii M et al JACS 2018; 226: 1004-1012
Potential Barrier to Surgeons Prescribing Less Opioids: Concern about Patient Satisfaction Scores

“Hawkeye” Pierce, MD
General Surgery
Areas of Focus

• Trauma surgery
• Hernia repair
• Surgical critical care

Patient comments

Dr. Pierce had a great sense of humor but he didn’t give me enough pain medicine after my operation.
Fewer Opioid Pills Prescribed

Mean Number of Pills Prescribed

- Period A: 28.3
- Period B: 13.3

P < 0.01
Overall Provider Satisfaction From All Patients (Index Plus Other cases) Throughout Study Period, N = 640

- **Timeframe A**: N = 236, Highest = 9.55
- **Timeframe B**: N = 404, Highest = 9.59

\[ P = 0.62 \]
What happens to excess pills?

FDA approved disposal:

• First DH outpatient study: 9%
• Our Inpatient study 1 year later: 19%
• Prospective study of pt info: 20%*

Take Back Days

Next Steps…..excess pills problem

• Prospective study at Dartmouth to determine whether calling patients prior to their appointment after surgery increases use of an opioid drop-box in the pharmacy

• Will appropriate opioid prescribing and disposal decrease the % of patients using opioids one year after surgery?

• Applied for funding with U Michigan and others to prospectively study the use of a charcoal inactivation system (Deterra) to inactivate excess pills
Some good news……

• In 2017 the number of opioid pills prescribed nationally decreased by 9%.

• New Hampshire was the top state in the nation, with a 15.1% decrease in opioid prescriptions.
